

AI and model integration

Ideas for the (near) future

Andrea E. Rizzoli

Do standards solve the problem?

- ✦ The actual **reusability** of model components is limited
- ✦ Model components are **framework dependent**
- ✦ A great deal of **hidden knowledge** is required to use models
- ✦ Integrated models are as good as our mental models are

There is a fundamental underlying problem

- ✦ Software handles only numbers
 - ✦ Model components are **poor incarnations** of much richer systems
 - ✦ Modelling **assumptions are not encoded** in software implementations
- ✦ Consequences: **misuses** and **abuses**

Knowledge is power

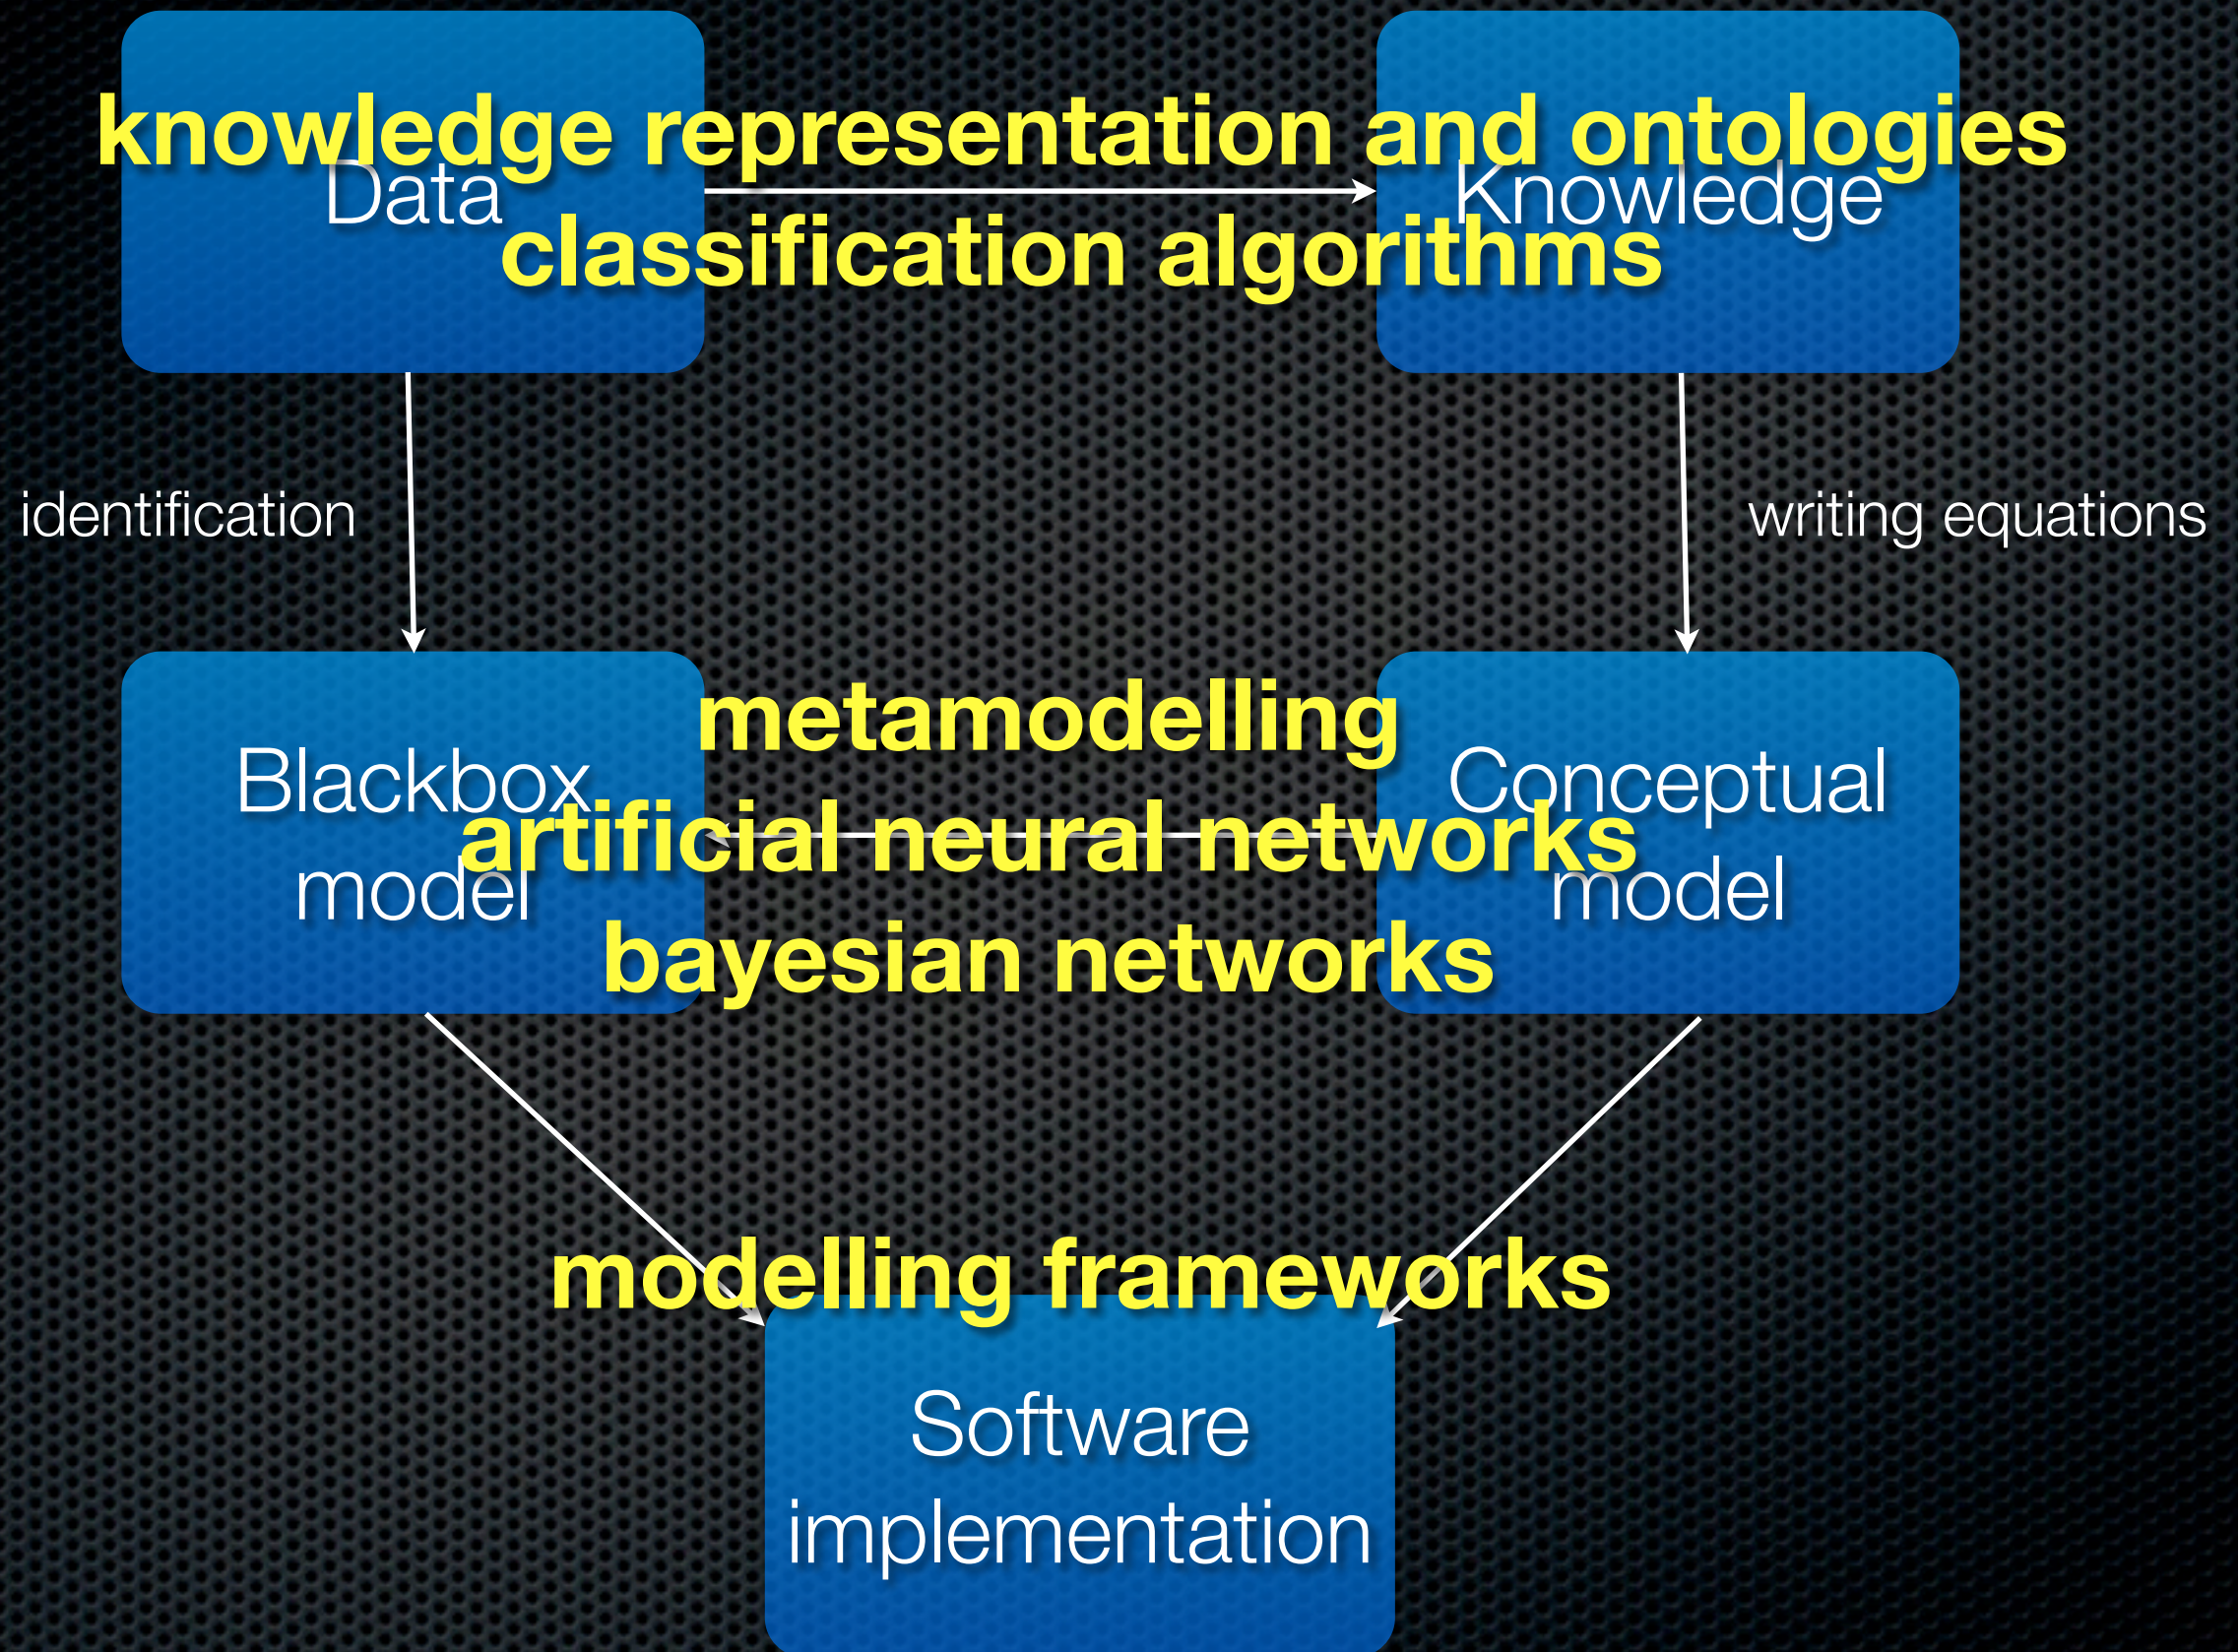

- ✦ We need to **make explicit** the knowledge in models
- ✦ We can **formally describe** the main concepts of a modelling domain and their relationships
- ✦ We can apply **automated reasoning**
- ✦ We can understand **which** model can do **what**, **when** and **where**, and we can ask the model to explain **why**

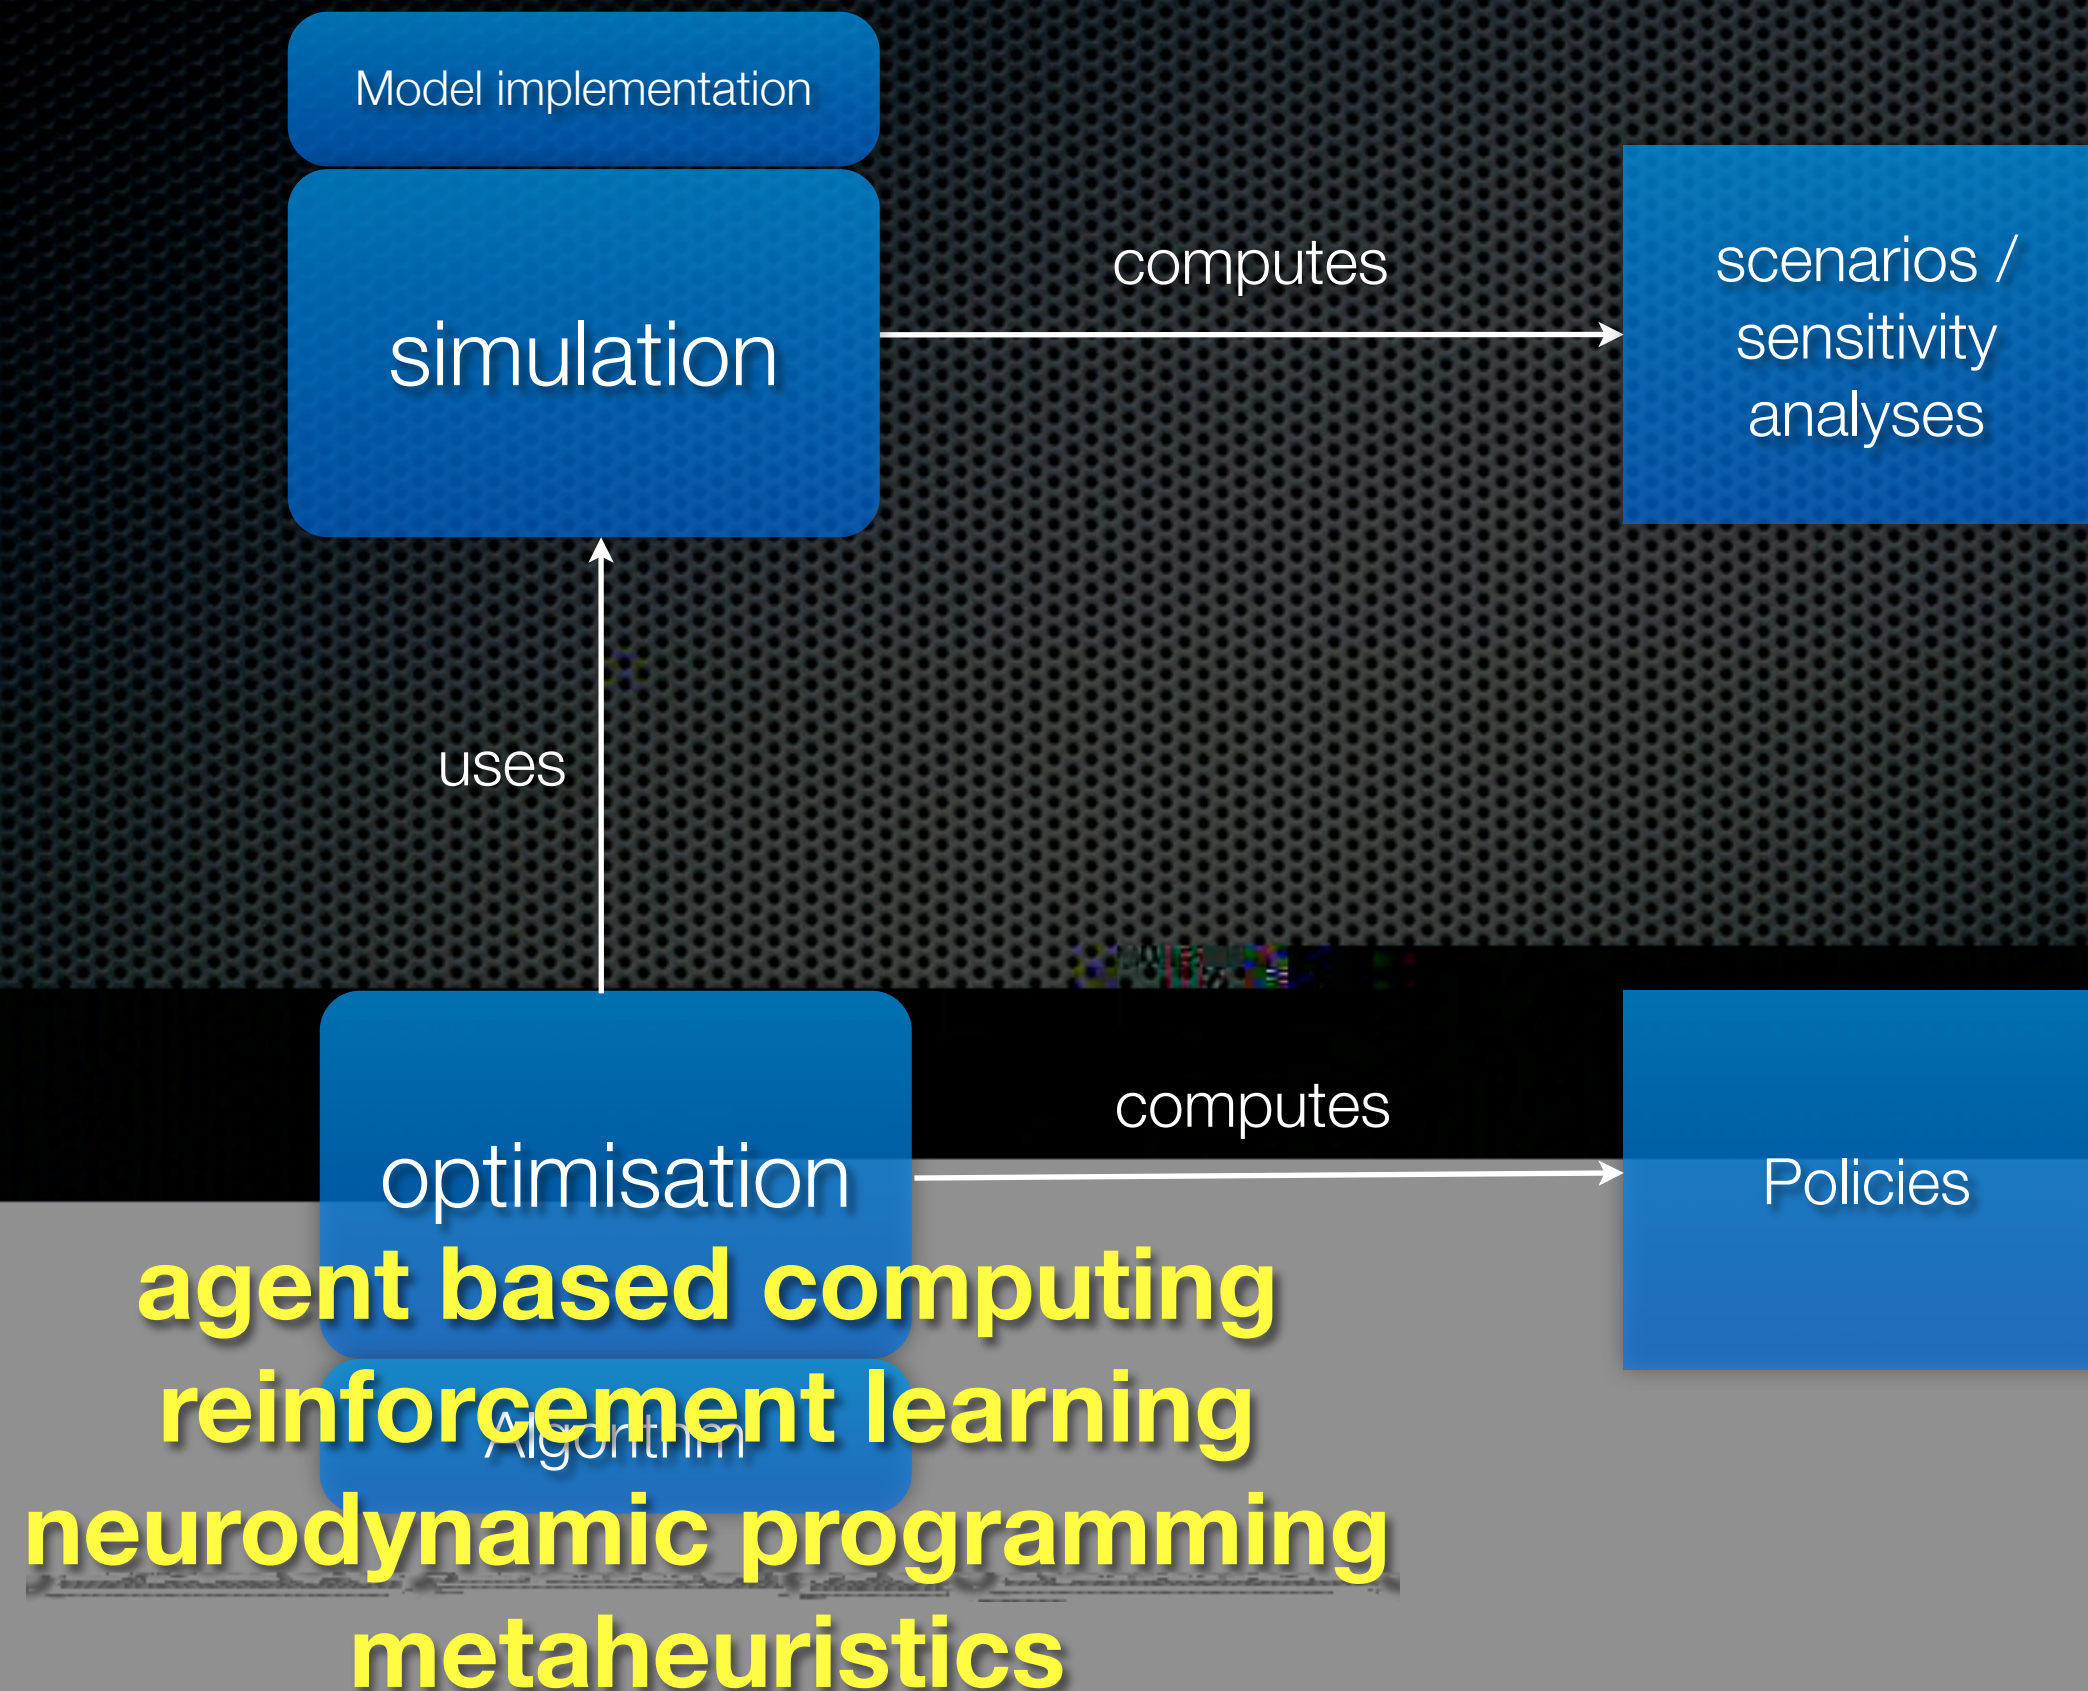

How to get there

- ✦ A step-by-step approach
 - ✦ develop **knowledge bases** to be shared
 - ✦ offer **models as services** accessible on the Net
 - ✦ **more and deeper info** in models and data: tag existing resources
 - ✦ **automate** search, discovery and linking
 - ✦ develop **reasoning** tools and algorithms

The role of AI: examples

Knowledge-based model integration

I need the
LeafAreaIndex

Here it is my LAI

I can produce
AirTempMAX

Who can calculate
Air.Temperature.Max.Daily?

Εχω χάσει τον
μπούσουλα

What about VARI?

MeanSoilTemperature is a daily or an
annual average?

Capito?

!@#\$%#\$\$%^?

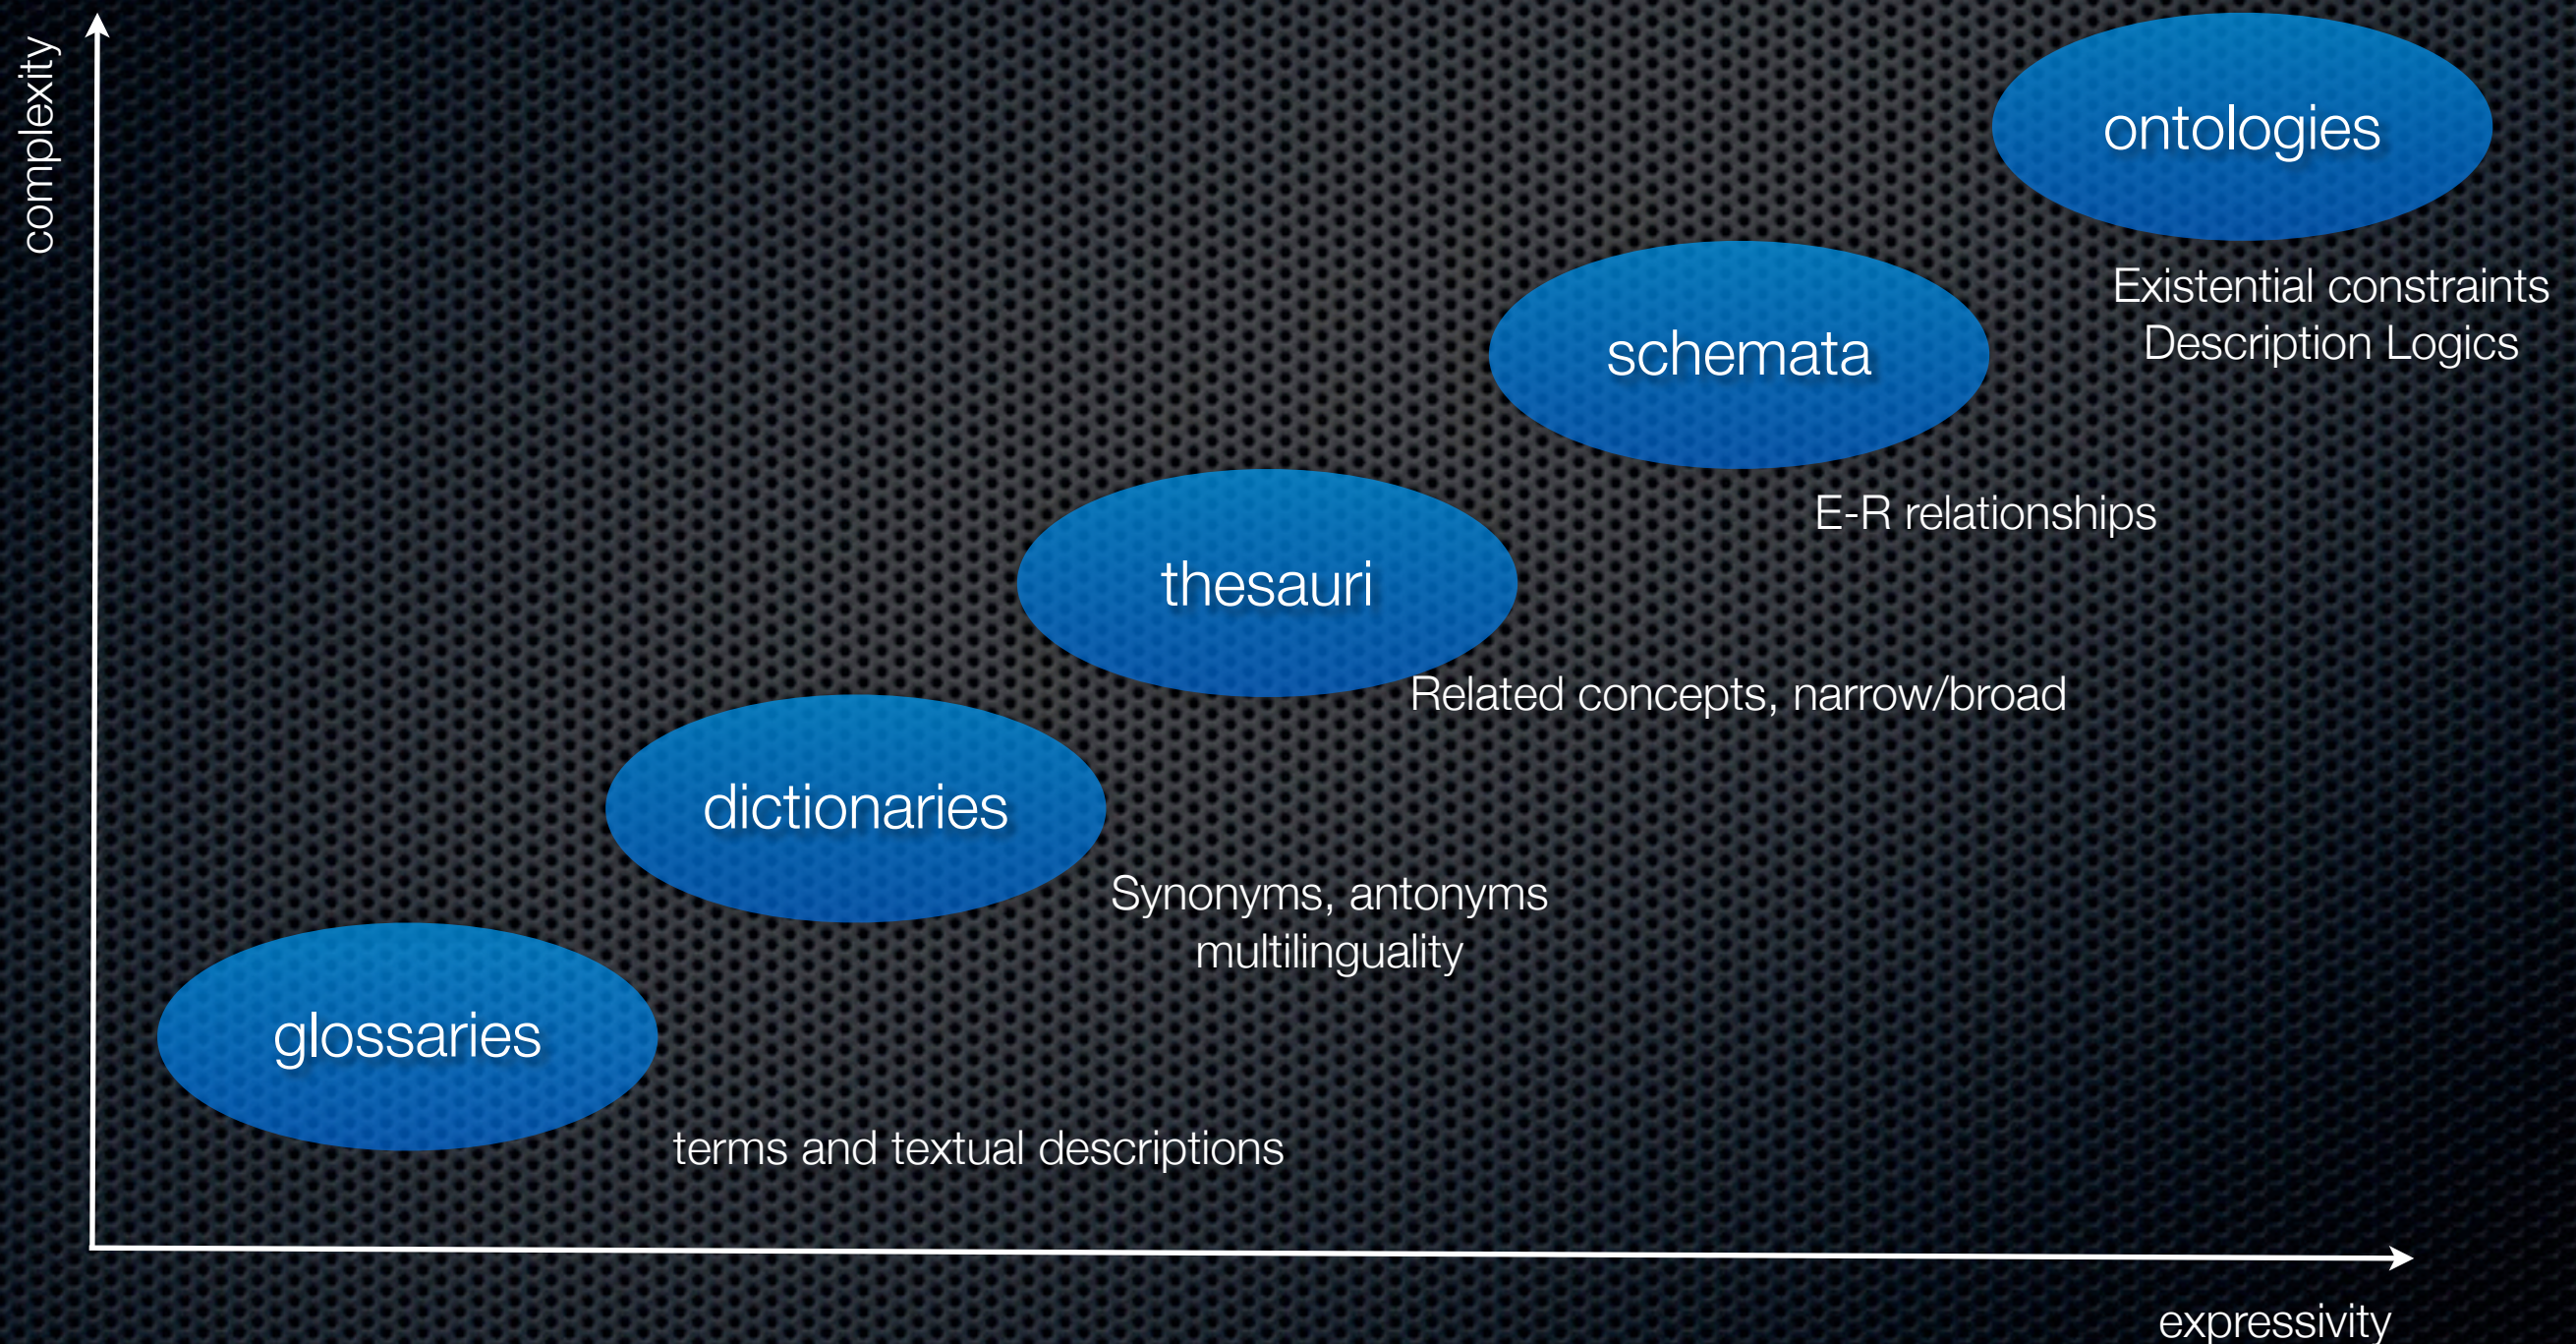

It is not a Babel, but still...

- ✧ A shared dictionary for model inputs and outputs
 - ✧ Not just common naming conventions

Not just “meta-data”

- ✧ A common reference that aims to:
 - build a shared view on systems modeled
 - ✧ identify unclear “spots”
 - integrate our models in a sound way

Domain modeling

Semantically rich interfaces

- ✧ Ontologies = wrapping paper
- ✧ The Model Interface Ontology
 - ✧ encapsulates modeler's knowledge (perception) of the model interface
 - ✧ in a declarative fashion
- ✧ Example: a model interface for continuous system simulation
 - ✧ exposes both stocks (states) and flows (rates of inputs and outputs)
 - ✧ is accessed by a simulation engine (for the numerical integration)
